Moving Beyond the Plateau: From Intermediate to Advanced Levels in Language Learning

Jack C. Richards

In this booklet we will examine some of the typical problems learners often encounter when they move from the lower-intermediate to the upper-intermediate/advanced level of language proficiency. In particular we will explore the problems learners seeking to make this transition sometimes encounter - the fact that they appear to have reached a plateau in their language learning and do not perceive that they are making further progress. We will explore some of the features of this apparent language-learning plateau and suggest strategies to help learners overcome this problem.

Many second or foreign language learners will confirm that language learning does not always follow a smooth progression as the learner moves from the basic, intermediate to advanced levels in his or her language proficiency. There are times when progress seems to be marked and noticeable, as for example with basic-level language learners after their first 200 or so hours of instruction as they begin to break through the threshold of learning to become real users of the language, even if at a fairly simple level. Those who have experienced the transition to this level of learning recall the feelings of satisfaction and achievement that comes with it as the learner finds he or she is actually capable of real communication in English. Reaching this level of learning however is no simple matter. Acquiring a usable supply of essential and high frequent vocabulary does not come easily, nor the ability to recall and use the correct grammar and conversational patterns at the appropriate times and to be able to understand both the gist and sometimes the details of the language the learner hears.

Once the learner has arrived at an intermediate level of language learning however, progress does not always appear to be so marked, and making the transition from intermediate to the upper-intermediate or advanced level sometimes proves frustrating for many learners. For some they may feel they have arrived at a plateau and making further progress seems elusive, despite the amount of time and effort the learner devotes to it.

A Chinese scholar, Fan Li, described the phenomenon in the following way:
An EFL learner of average intelligence usually does not have much difficulty in the early stage of learning. Because of curiosity and assumption that he or she can make an immediate use of what he or she is learning to communicate with English-speaking people, the learner is highly motivated at the early stages of learning. The learner imitates, memorizes and practices all the input from the teacher and the textbook. Though mechanically to a great extent, he or she does try hard to learn. On the other hand, as all the input of the English language is absolutely new to the learner, it is stimulating and easy to remember. When stimuli are new to the learner, the learner is more motivated to learn and memorize them. So most EFL learners can have a good start in learning no matter what teaching approaches are used.

However, as the learning process goes on, the learner finds it harder and harder to take in new language data. The teacher also finds that his input, no matter how much he or she tries to make it interesting, is no longer as easily taken in by the learners as it used to be. The students are more and more discouraged by the fact that their ambition of mastering English as a means of communication turns out to be a false assumption. They find that they know a lot about the English language, but they can hardly say they know English. It is during this period of time that many EFL learners suffer great anxiety and eventually give up their efforts to learn the English language. Later on, for one reason or other, they have to start learning English again. They soon meet the same problem. As this circle rolls over again and again, they fail to be able to acquire a real competence to communicate by means of English, even if they may have studied English for more than ten years.

Fan Li 2007

Inevitably learners who have reached the upper intermediate level will have somewhat different language use profiles and learning needs but the following problems are often encountered:

a) **There is a gap between receptive and productive competence.** The learner may have made considerable progress in listening comprehension and reading, but still feels inadequate when it comes to speaking skills.

b) **There are persistent fossilized language errors.** Errors that are typical of lower level-learners have not disappeared and reappear in certain circumstances despite the amount of time and effort devoted to correcting them.

c) **Fluency may have progressed at the expense of complexity.** The learner may make primary use of lower-level grammar as well as vocabulary and communication strategies to express his or her meaning and not have acquired more sophisticated language patterns and usage characteristic of more advanced second language users.

d) **The learner has a limited vocabulary range.** Vocabulary development has not progressed sufficiently. The learner tends to over-use lower-level
vocabulary and fails to acquire more advanced level vocabulary and usage.

e) **Language production may be adequate but often lacks the characteristics of natural speech.** The learner’s English may be fluent and grammatical but sounds too formal or too bookish.

Let us explore each of these features in a more detail.

1. **There is a gap between receptive and productive competence**

*Key characteristics:*

- While the learner’s receptive competence continues to develop, his or her productive competence remains relatively static.
- Language items which the learner recognizes and understands in the input he or she hears, do no pass into the learner’s productive competence.

All language users have greater receptive competence (language the learner can understand) than productive competence (language he or she can produce). I can read great novels for example, but I could never write one. Traditionally in language teaching we recognize this fact in the distinction between active and passive language knowledge, particularly in relation to vocabulary learning, where it is normally assumed that the learner should be able to understand far more words than he or she can use. And it has generally been accepted that in second language learning, new items first become part of the learner’s receptive competence before they become part of his or her productive competence. Kashen (1982) proposed that in language teaching more effort should be devoted to developing the learner’s receptive than productive competence and claimed that productive ability will arise naturally from receptive knowledge. In particular, Krashen stressed that meaningful comprehension rather than focussed production is all that is needed to facilitate language learning.

However this is not always confirmed in the experience of learners, who often find that their productive skills are well below the level they would like them to be, despite reasonably good comprehension skills. Learners may be unable to apply their language knowledge in actual use, hence their linguistic knowledge at the cognitive level is not utilized during performance. As Fan Li points out (cited above), a consequence is that learners’ feelings of anxiety or frustration may increase. They may eventually lose confidence and determination and their motivation to continue learning English may be affected.
Recent theories of second language acquisition however no longer assume that productive skills will arise naturally from comprehension skills. Two other factors are necessary if we are to reduce the gap between receptive and productive competence: noticing, and focussed output (the output hypothesis).

**The noticing hypothesis**: Schmidt has drawn attention to the role of consciousness in language learning, and in particular to the role of noticing in learning. Schmidt (1986, 1990) proposed that for learners to acquire new forms from input (language they hear) it is necessary for them to notice such forms in the input. His argument is that we won’t learn anything from input we hear and understand unless we notice something about the input. Consciousness of features of the input can serve as a trigger which activates the first stage in the process of incorporating new linguistic features into ones language competence. As Slobin (1985:1164) remarked of first language learning:

> The only linguistic materials that can figure in language-making are stretches of speech that attract the child’s attention to a sufficient degree to be noticed and held in memory.

Schmidt (1990,139) further clarifies this point in distinguishing between input (what the learner hears) and intake (that part of the input that the learner notices). Only intake can serve as the basis for language development. In his own study of his acquisition of Portuguese (Schmidt and Frota 1986), Schmidt found that there was a close connection between noticing features of the input, and their later emergence in his own speech. Schmidt lists the following features are likely to contribute to the extent to which noticing features of the input occurs:

- Frequency of encounter with items
- Perceptual saliency of items
- Instructional strategies that can focus learner’s attention
- Individual processing ability (which is related to the learner’s aptitude for language learning)
- Task demands, or the nature of the activity the learner is taking part it

In teaching listening and speaking skills for example, noticing activities can involve returning to the listening texts that served as the basis for comprehension activities and using them as the basis for language awareness. For example students can listen again to a recording in order to:

- identify differences between what they hear and a printed version of the text
• complete a cloze version of the text
• complete sentences stems taken from the text
• check off from a list, expressions that occurred in the text

They can then practice using some of the forms which they noticed.

The output hypothesis: Swain (1985, 2000) proposed that successful language acquisition requires not only comprehensible input, but also comprehensible output, that is, language produced by the learners that can be understood by other speakers of the language. Swain suggested that when learners have to make efforts to ensure that their messages are communicated (which she refers to as “pushed output”) this puts them in a better position to notice the gap between their productions and those of proficient speakers, thus fostering second language development. Carefully structured and managed output (the output hypothesis) is essential if learners are to acquire new language. Managed output here refers to tasks and activities that require the use of certain target-language forms, i.e. which “stretch” the learner’s language knowledge and that consequently require a “restructuring” of that knowledge (see further below). The output hypothesis suggests the rather obvious notion that practice in using target language forms is necessary for the learner to take on and acquire new target language. Swain and Lapkin (1995 summarized in Saville-Troike 2006) suggest that meaningful production practice helps learners by:

• Enhancing fluency by furthering development of automaticity through practice.
• Noticing gaps in their own knowledge as they are forced to move from semantic processing to syntactic processing, which may lead learners to give more attention to relevant information.
• Testing hypotheses based on developing interlanguage, allowing for monitoring and revision.
• Talking about language, including eliciting relevant input and (collaboratively) solving problems

In teaching listening skills for example, output-based activities can consist of oral or written tasks that involve productive use of selected items from a listening text. Such activities could include:

• in the case of conversational texts, pair reading of the tape scripts
• written sentence-completion tasks requiring use of expressions and other linguistic items that occurred in the texts
• dialog practice based on dialogs that incorporate items from the text
• role plays in which students are required to use key language from the texts

5
2. The persistence of fossilized language errors

Key characteristics:

- Errors of both grammar and pronunciation have become permanent features of a learner's speech
- Errors persist despite advances in the learner's communicative skills

Fossilization refers to the persistence of errors in a learner's speech despite progress in other areas of language development (Lightbown and Spada 2006). They are errors that appear to be entrenched and difficult to eradicate, despite the teacher's best efforts. For example here are a few examples of fossilized errors in an adult fluent speaker of English in Hong Kong who uses English regularly and effectively, though often with a high frequency of what we might regard as basic grammatical and other errors.

I don't understand what she wanted.
He never ask me for help.
Last night I watch TV till 2 am.
Just I was talking to him.
She say she meeting me after work.

There has been a great deal written about the phenomenon of fossilization and researchers have examined such issues as which aspects of language are more likely to become fossilized in learners, the kind of learners who are likely to be affected by it, the kinds of fossilization that can occur, and so on. Some have linked fossilization to an over-emphasis on communication in language teaching at the expense of accuracy. The promise that the communicative classroom activities would help learners develop both communicative competence as well as linguistic competence did not always happen. Programs where there was an extensive use of “authentic communication”, particularly in the early stages of learning reported that students often developed fluency at the expense of accuracy resulting in learners with good communication skills but a poor command of grammar and a high level of fossilization (Higgs and Clifford 1982).

One feature of fossilized language items that suggests a partial explanation for the phenomenon is that fossilized errors tend not to affect our understanding of the speaker, although they might be irritating and may also be stigmatised, since they often reflect errors that are typical of very basic-level learners (such as omission of 3rd person “s”). Since fossilized errors do not generally trigger misunderstanding and hence do not prompt a clarification request from the listener, the learner may simply never notice them or be aware that they are
there. And as we saw above in discussing the noticing hypothesis, unless the speaker notices such errors, it is unlikely that he or she will correct them.

Motivation is another factor. Some learners may feel that since English is not their first language anyway, it is perfectly acceptable for them to make mistakes and it is not particularly important anyway. They are more interested in making themselves understood and less concerned about the aesthetic impact of their English on the listener. If this is the case there is little that the teacher can do unless the learner undergoes a change of attitude, something that will depend upon the social role that English plays in his or her life. Other learners however may be motivated to acquire an error-free English, and the following questions then arise.

How can the learner become aware of (i.e. notice) the fossilized errors in his or her own speech?
What kind of instructional techniques are likely to be most effective in helping remove fossilized errors?

Suggestions for addressing the first question involve learners becoming active monitors of their own language production, through listening or viewing recordings of their own speech; through having others monitor his or her speech for fossilized errors in focussed listening sessions. The second question leads into the area of error correction and the issue of what kinds of errors or correct, when, and how. This brings us back to the noticing hypothesis and the output hypothesis discussed above, which suggest that to address fossilization, classroom activities should involve the following:

- Incorporating a more explicit treatment of grammar within the curriculum
- Building a focus on form into teaching through the use of activities centering on consciousness raising or noticing grammatical features of input or output
- Using activities that require “stretched output”, i.e. which expand or ‘restructure” the learner’s grammatical system though increased communicative demands and attention to linguistic form

Examples will be discussed in the following section.
3. Fluency may have progressed at the expense of complexity

Key characteristics:
- Learner’s language may be both relatively fluent and accurate but shows little evidence of appropriate grammatical development
- Complexity of the learner’s language does not match his or her proficiency level

A common distinction in language teaching is between fluency and accuracy. Fluency describes a level of proficiency in communication which includes;
- The ability to produce language with ease
- The ability to speak with a good but not necessarily perfect command of intonation, vocabulary, syntax and grammar
- The ability to express one’s ideas coherently
- The ability to produce continuous speech without causing comprehension difficulties, with minimum breakdowns and disruptions

However there is an additional important dimension in language development, and that is the complexity of the learner’s interlanguage. The development of fluency may mean greater ease of use of known language forms but does not necessarily imply development in the complexity of the learner’s language. Skehan (1998) argues that ideally, fluency, accuracy, and complexity develop in harmony, but this is not always the case. In order for the learner’s language to complexify, new linguistic forms have to be acquired and added to the learner’s productive linguistic repertoire. This was referred to above as restructuring.

Van Patten (1993,436) suggests that restructuring involves processes; that mediate the incorporation of intake into the developing system. Since the internalization of intake is not a mere accumulation of discrete bits of data, data have to ‘fit in’ in some way and sometimes the accommodation of a particular set of data causes changes in the rest of the system. In some cases, the data may not fit in at all and are not accommodated by the system. They simply do not make it into the long-term store.

For example if a learner has mastered the present and past tenses and is comfortable using them, once he or she encounters the perfect, his or her linguistic system has to be revised to accommodate new distinctions communicated by the perfect. There may be a time when the learner overuses the known forms (present and past) until his or her system has restructured to incorporate the perfect. But as Van Patten remarks, sometimes this restructuring may not occur and the newly encountered form will not pass into the learners’ linguistic system. For the learner’s linguistic system to take on new and more complex linguistic items, the restructuring or reorganization of mental
representations is required, as well as opportunities to practice these new forms (the output hypothesis).

Ways of increasing the opportunities for restructuring to occur can occur at three different stages during an activity: prior to the activity, during the activity, or after completing an activity. In each case a language focus is provided in an attempt to support the learning of more complex language items.

a) addressing language prior to the activity

Here there are two goals: (1) to provide language support that can be used in completing a task: (2) to clarify the nature of the task so that students can give less attention to procedural aspects of the task and hence monitor their language use during their performance while carrying out a task. Skehan notes (1996, 53): ‘Pre-task activities can aim to teach or mobilise, or make salient language which will be relevant to task performance’. This can be accomplished in several ways:

1. By pre-teaching certain linguistic forms that can be used while completing a task. For example, prior to completing a role-play task which practices calling an apartment owner to discuss renting an apartment, students can first read advertisements for apartments and learn key vocabulary they will use in a role play. They could also listen to and practice a dialog in which a prospective tenant calls an apartment owner for information. The dialog serves both to display different questioning strategies and to model the kind of task the students will perform.

2. By reducing the cognitive complexity of the activity. If an activity is difficult to carry out, learners’ attention may be diverted to the structure and management of the task, leaving little opportunity for them to monitor the language they use on the task. One way of reducing the cognitive complexity of the activity is to provide students with a chance for prior rehearsal. This is intended to ease the processing load that learners will encounter when actually doing a task. This could be achieved by watching a video or listening to a recording of learners doing a task similar to the target task or it could be a simplified version of the activity the learners will carry out. Dialogue work prior to carrying out the role-play referred to above serves a similar function.

3. By giving time to plan the activity. Time allocated to planning prior to carrying out an activity can likewise provide learners with schemata, vocabulary and
language forms that they can call upon while completing the task. Planning activities include vocabulary-generating activities such as brainstorming, or strategy activities in which learners consider a range of strategies for solving a problem, discuss their pros and cons, and then select which they will apply to the task.

b) Addressing language during an activity

A focus on language can be facilitated during the completion of an activity by choosing how the activity is to be carried out. The way it is implemented can determine whether it is carried out fluently and with a focus on target language forms, or disfluently with excessive dependence on communication strategies, employment of lexicalized rather than grammaticalized discourse, and overuse of ellipsis and non-linguistic resources. Task implementation factors include:

- Participation: whether the activity is completed individually or with other learners
- Procedures: the number of procedures involved in completing an activity
- Resources: the materials and other resources provided for the learners to use while completing an activity
- Order: the sequencing of an activity in relation to previous tasks
- Product: the outcome or outcomes students produce, such as a written product or an oral one

The effect of participation arrangements on task performance has been noted by several scholars. Foster found that dyads rather than groups coupled with the obligation to exchange information, was the best for language production, negotiations and modified output (1998, 18).

Resources students work with can also affect task performance. The use of pictures in a story-telling activity might provide an accessible framework or schema for the story, clarifying such elements as setting, characters, events, outcomes, and so on, giving the learners more opportunity to focus their planning or performance on other dimensions of the task. Or in conducting a survey task, the design of the resources students use could have a crucial impact on the appropriateness of the language used in carrying out the task. If the survey form or questionnaire students use provides models of the types of questions they should ask, it may result in a better level of language use during questioning and make other aspects of the task easier, since less planning will need to be devoted to formulating appropriate questions.

Procedures used in completing an activity can also be used to influence language output. An activity that is divided into several shorted sub-tasks may be more
manageable than one without such a structure, allowing students to deal with one section of the task at a time.

The order of an activity in relation to other tasks may influence the use of target structures. For example, if students are to carry out an activity that requires the use of sequence markers, a prior activity which models how sequence markers are used may result in more frequent use of sequence markers during the performance of the target task (see Swain 1998).

The product focus of an activity will also influence the extent to which students have the opportunity to attend to linguistic form. A task may be competed orally, it may be recorded or it may require writing. In each case, different opportunities for language awareness and production are involved. Swain (1999, 3) describes how tasks with a written product provide an opportunity for students to focus on form.

Students, working together in pairs, are each given a different set of numbered pictures that tell a story. Together the pair of students must jointly construct the story-line. After they have worked out what the story is, they write it down. In so doing, students encounter linguistic problems they need to solve to continue with the task. These problems include how best to say what they want to say; problems of lexical choice; which morphological endings to use; the best syntactic structures to use; and problems about the language needed to sequence the story correctly. These problems arise as the students try to “make meaning”, that is, as they construct and write out the story, as they understand it. And as they encounter these linguistic problems, they focus on linguistic form – the form that is needed to express the meaning in the way they want to convey it.

Learners can also record their performance of an activity and then listen to it and identify aspects of their performance that require modification.

c) Addressing language use after the activity

Grammatical appropriateness can also be addressed after a task has been completed (see Willis and Willis 1966). Activities of this type include the following:

Public performance: After completing an activity in small groups, students carry out the same task in front of the class or another group. This can have the effect of prompting them to perform the activity using more complex language. Aspects of their performance which were not initially in focus during in-group performance
can become conscious as there is an increased capacity for self-monitoring during public performance of the activity.

*Repeat performance:* The same activity might be repeated with some elements modified, such as the amount of time available. Nation (1989) for example, reports improvements in fluency, control of content, and to a lesser extent, accuracy, when learners repeat an oral task under time constraints and argues that this is a way of bringing about long-term improvement in both fluency, and to some extent, accuracy.

*Other performance:* The students might listen to more advanced learners (or even native speakers) completing the same task, and focus on some of the linguistic and communicative resources employed in the process. In other words, they can carry out noticing activities while listening to examples other performance.

4. The learner has a limited vocabulary range.

*Key characteristics:*

- The learner’s vocabulary development is still at the 3000 word level.
- The learner lacks knowledge of collocational patterns.

Vocabulary development plays a vital role in making the transition from an intermediate to a more advanced level of language proficiency, but many learners appear to have reached a plateau of learning in relation to vocabulary. This may be seen in over-use of lower-level vocabulary and failure to acquire more advanced level vocabulary as well as limited awareness of collocational usage. In terms of the quantitative dimension of vocabulary learning, vocabulary development can be thought of as involving acquisition of a core vocabulary which is common to many different domains, genres, and text types, as well as building up more specialized vocabulary related to the learner’s own fields of interests and needs, whether these be academic, occupational, or social. How big is this core vocabulary?

Researchers suggest that knowing a minimum vocabulary of 3000 words is required to provide coverage of a high percentage of words on an average page of a text. This represents a target for the lower intermediate learning level. Hu and Nation (1992) found that a vocabulary of 5000 words was needed to read short
unsimplified novels for pleasure, while Hazenberg and Hulstijn (1996) found that twice as many words as that were needed to read first-year university materials.

In addition to this core vocabulary there are another 1000 or so words common to academic disciplines, sometimes referred to as the basis for an academic vocabulary. However once they reach the intermediate level learner’s often fail to make sufficient gains in their vocabulary knowledge. A study of college students’ vocabulary development in China found that during their first two years of university study, English major’s vocabulary increased by 1500 words on the average each year; but in the later two years, their vocabulary increased only by 250 words on average each year (Fan Li 2007).

O’Keeffe et al (2007, 48-9) comment:

A receptive vocabulary of some 5000 to 6000 words would appear to be a good threshold at which to consider learners at the top of the intermediate level and ready to take on an advanced program. Such a program would ideally have the following aims:

- To increase the receptive vocabulary size to enable comprehension targets above 90% (e.g. up to 95%) for typical texts to be reached.
- To expose the learner to a range of vocabulary at frequency levels beyond the first 5000-6000 word band, but which is not too rare or obscure to be of little practical use.
- To inculcate the kinds of knowledge required for using words at this level, given their often highly specific lexical meanings and connotations.
- To train awareness skills and strategies that will help the learner become an independent vocabulary-learner and user who can continue the task for as long as (s)he desired”

“Knowing a word” of course involves far more than simply recognizing the meaning of a word. Gairns and Redman (1986 cited in Moras 2007) include the following components of lexical competence:

- **Boundaries between conceptual meaning**: knowing not only what lexis refers to, but also where the boundaries are that separate it from words of related meaning (e.g. cup, mug, bowl).
- **Polysemy**: distinguishing between the various meaning of a single word form with several but closely related meanings (head: of a person, of a pin, of an organisation).
- **Homonymy**: distinguishing between the various meaning of a single word form which has several meanings which are NOT closely related (e.g. a file: used to put papers in or a tool).
- **Homophony**: understanding words that have the same pronunciation but different spellings and meanings (e.g. flour, flower).
- **Synonymy**: distinguishing between the different shades of meaning that synonymous words have (e.g. extend, increase, expand).
- **Affective meaning**: distinguishing between the attitudinal and emotional factors (denotation and connotation), which depend on the
speakers attitude or the situation. Socio-cultural associations of lexical items is another important factor.

- **Style, register, dialect:** Being able to distinguish between different levels of formality, the effect of different contexts and topics, as well as differences in geographical variation.
- **Translation:** awareness of certain differences and similarities between the native and the foreign language (e.g. false cognates).
- **Chunks of language:** multi-word verbs, idioms, collocations and lexical phrases.
- **Grammar of vocabulary:** learning the rules that enable students to build up different forms of the word or even different words from that word (e.g. sleep, slept, sleeping; able, unable; disability).
- **Pronunciation:** ability to recognise and reproduce items in speech.

One of the key problems in helping learners improve their vocabulary is finding effective ways for them to help remember words they have encountered. How can we help learners move words from short-term to long-term memory? One clue is from research on memory. Gairns and Redman (1986) point out that our mental lexicon is highly organised and efficient, and that items that are related semantically are stored together. This is why it is much easier to recall a list of words that are grouped or organized in a meaningful way, as compared with trying to recall a set of words that are simply organized alphabetically. Word frequency also plays a role, since the more frequently a word is encountered, the easier it is to remember.

Helping learners develop their own approaches to vocabulary learning is also an important goal at the advanced level so that learners can deal with new words they encounter in independent learning. Moras (2007) recommends the use of guided discovery, contextual guesswork and mastering effective dictionary use as effective teaching and learning strategies.

Guided discovery involve asking questions or offering examples that guide students to guess meanings correctly. In this way learners get involved in a process of semantic processing that helps learning and retention.

Contextual guesswork means making use of the context in which the word appears to derive an idea of its meaning, or in some cases, guess from the word itself, as in words of Latin origin. Knowledge of word formation, e.g. prefixes and suffixes, can also help guide students to discover meaning. Teachers can help students with specific techniques and practice in contextual guesswork, for example, the understanding of discourse markers and identifying the function of the word in the sentence (e.g. verb, adjective, noun). The latter is also very useful when using dictionaries.

Students should start using EFL dictionaries as early as possible, from Intermediate upwards. With adequate training, dictionaries are an invaluable tool for learners, giving them independence from the teacher. As well as understanding meaning, students are able to check pronunciation, the grammar of the word (e.g. verb patterns, verb forms, plurality,
comparatives, etc.), different spelling (American versus British), style and register, as well as examples that illustrate usage.

Another dimension of vocabulary development which is essential if students are to make a successful transition to the advanced level is to expand what has been called their collocational competence. Collocation refers to restrictions on how words can be used together, such as which prepositions are used with particular verbs, or which verbs and nouns are used together. Corpus analysis has allowed common collocational patterns in English to be easily identified (O’Keeffe et al 2007). Knowledge of collocations is vital for effective language use and a sentence that is grammatically correct will look or sound ‘awkward’ if collocational preferences are not used. For example we can say “blond hair”. But not “blond car”, “lean meat”, but not “slim meat”, “perform a play” but not “perform a meeting.” Vocabulary development does not only involve acquiring new words. It also involves expanding knowledge of the collocational patterns that known words can enter into.

O’Keeffe et al (2007) comment

One may conclude that collocations, along with semantically transparent and opaque, idiomatic chunks, form the main component of the multi-word lexicon and that the multi-word lexicon is at the heart of advanced level lexical knowledge, given that the challenge at this level is as much to do with grappling with observing recurrent collocations and chunks (which will most often consist of words already known individually) as it is with simply pushing for a (never-ending) linear increase in the vocabulary size base on single words never seen before” (53).

5. Language production may be adequate but often lacks the characteristics of natural speech.

Key characteristics:

- Learner’s spoken English may be accurate and fluent but not always sound natural
- Learner’s spoke English lacks appropriate use of chunks and formulaic utterances

The goal for many language learners is to be able to communicate comprehensible, effectively, and appropriately. For some the goal may be to approximate as closely as possible to the norms of native-speaker English. For others this may not be a goal since they subscribe to the notion of English as an International Language - English as it is used by people with no other common language and reflecting the cultural and linguistic identities of the people who use it. Despite the learner’s personal goals for learning English however, many will
want their English to sound both fluent and natural, even if spoken with an accent that reflects the learner’s mother tongue. Many learners achieve a high level of fluency in their English yet are told that their English often sounds unnatural. What gives a language the quality of sounding natural?

There are many factors that can contribute to the naturalness of speech, but one important factor is the extent to which the learners are using what are sometime called multiword chunks as well as conversational routines or fixed expressions. Words do not occur together in speech in random patterns but often occur as multiword chunks that often occur together. These may be two, three, four five or even six- word chunks.

O’Keefe et al (2007, p.67) give the following list of the most frequent 6-word chunks that occur in the CANCODE corpus, a 5 million word corpus of spoken English:

A marked feature of conversational discourse is also the use of a subset of the multi-word units - conversational routines - which often have specific functions in conversation and which give conversational discourse the quality of naturalness (Nattinger 1980). These perform a variety of functions in spoken English and the teaching of these and other multi-word units is a feature of some recent English courses such as the *Touchstone* (McCarthey et al 2006) series. Hence when a learner uses English, in order for his or her usage to sound natural, utterances need to be expressed in the way they are conventionally said in English, and this is something that it is not often possible to predict. For example why do we say
when we meet someone for the first time, “Nice to meet you?” And not “To meet you is nice?” Both have the same meaning but the former is said but not the latter. Our linguistic or grammatical competence provides the basis for creating many different ways of saying things, however only a small subset of possible utterances is ever actually said. Wardhaugh (cited in Richards 1990) observes:

There are routines to help people establish themselves in certain positions: routines for taking off and hanging up coats; arrangements concerning where one is to sit or stand at a party or in a meeting; offers of hospitality, and so on. There are routines for beginnings and endings of conversations, for leading into topics, and for moving away from one topic to another. And there are routines for breaking up conversations, for leaving a party, and for dissolving a gathering ... It is difficult to imagine how life could be lived without some routines.

Consider the following routines. Where might they occur? What might there function be within those situations?

This one’s on me.
It was lovely to see you.
Thanks for coming.
I don’t believe a word of it.
I don’t get the point.
You look great today.
As I was saying ..
I’ll be making a move then,
I see what you mean.
Let me think about it.
Just looking thanks.
I’ll be with you in a minute.
It doesn’t matter.

In a classic paper on lexical routines, Pawley and Syder (1983) suggest that native speakers have a repertoire of thousands of routines or “chunks” like these, and their use in appropriate situations creates conversational discourse that sounds natural and native-like, and that they have to be learned and used as fixed expressions. Research by Prodromou (cited in O’Keeffe et al 2007) suggests that a key difference between the speech of advanced SUEs (successful users of English) and native-speakers is the presence or absence of chunks. He also raises the issue of whether it is important or necessary for SUEs to set out to fully master the use of chunks, since they often mark membership of a cultural group (e.g. Americans) that the learner may not wish to claim for have any reason to do so. O’Keeffe et al (2007) however suggest that “students who do wish to push towards near-native fluency should be given appropriate exposure to and practice in the use of chunks” (76).
This can be achieved through observing examples of natural discourse and noticing patterns of usage that occur in them and by working with tasks and materials that highlight the use of multi-word units and conversational routines and provide opportunities to practice using them.

**Conclusions**

From the discussion above we can identify a number of areas that need to be addressed if the learner is to move from the intermediate to an upper-intermediate or advanced level of language proficiency. He or she will now need to achieve the following:

- To expand his or her grammatical competence, including acquiring new ways of using known forms as well as adding more complex language resources to his or her language linguistic repertoire
- To become a more fluent and accurate language user
- To develop the capacity to monitor his or her own language use as well as that of others, and to notice the gap between his or her productive competence and those of more advanced language users
- To continue to develop his or her vocabulary particularly at the 5000 to 6000 word range.
- To develop a greater awareness and familiarity with patterns of lexical collocation
- To master the use of conversational routines and other means of participating actively in conversation and other forms of spoken discourse
- To further develop his or her proficiency in listening, reading and writing

Attaining these goals requires providing learners with a rich source of language learning experiences that allow for the gradual development of language skills across the different modalities of speaking, listening, reading and writing. These experiences should allow learners to become successful monitors and managers of their own learning, aware of the limitations of their current level of language ability but aware of the means by which they can move beyond the intermediate learning plateau to more advanced levels of language use.
